

# Smart Farmer-IOT Enabled Smart Farming Application

## Project Development Phase

### Sprint Delivery -1

<b>Date</b>	19 November 2022
<b>Team ID</b>	PNT2022TMID49973
<b>Project Name</b>	Smart Farmer-IOT Enabled Smart Farming Application
<b>Leader Name</b>	Vasanth M
<b>Team Members Name</b>	Vijaya Sundar M Vishnuvarathan R Vishnu Prasath S

### 1. Introduction:

The main aim of this project is to help farmers automate their farms by providing them with a Web App through which they can monitor the parameters of the field like Temperature, soil moisture, humidity

etc and control the equipment like water motor and other devices remotely via the internet without their actual presence in the field.

## **2. Problem Statement:**

Farmers need to deal with many problems like coping with climate change, soil erosion and Biodiversity loss. Farmers are to be present at farm for its maintenance irrespective of the weather conditions. They have to ensure that the crops are well watered and the farm status is monitored by them physically. Farmers have to stay most of the time in field in order to get a good yield. In difficult times like in the presence of pandemic also they have to work hard in their fields risking their lives to provide food for the country.

## **3. Proposed Solution:**

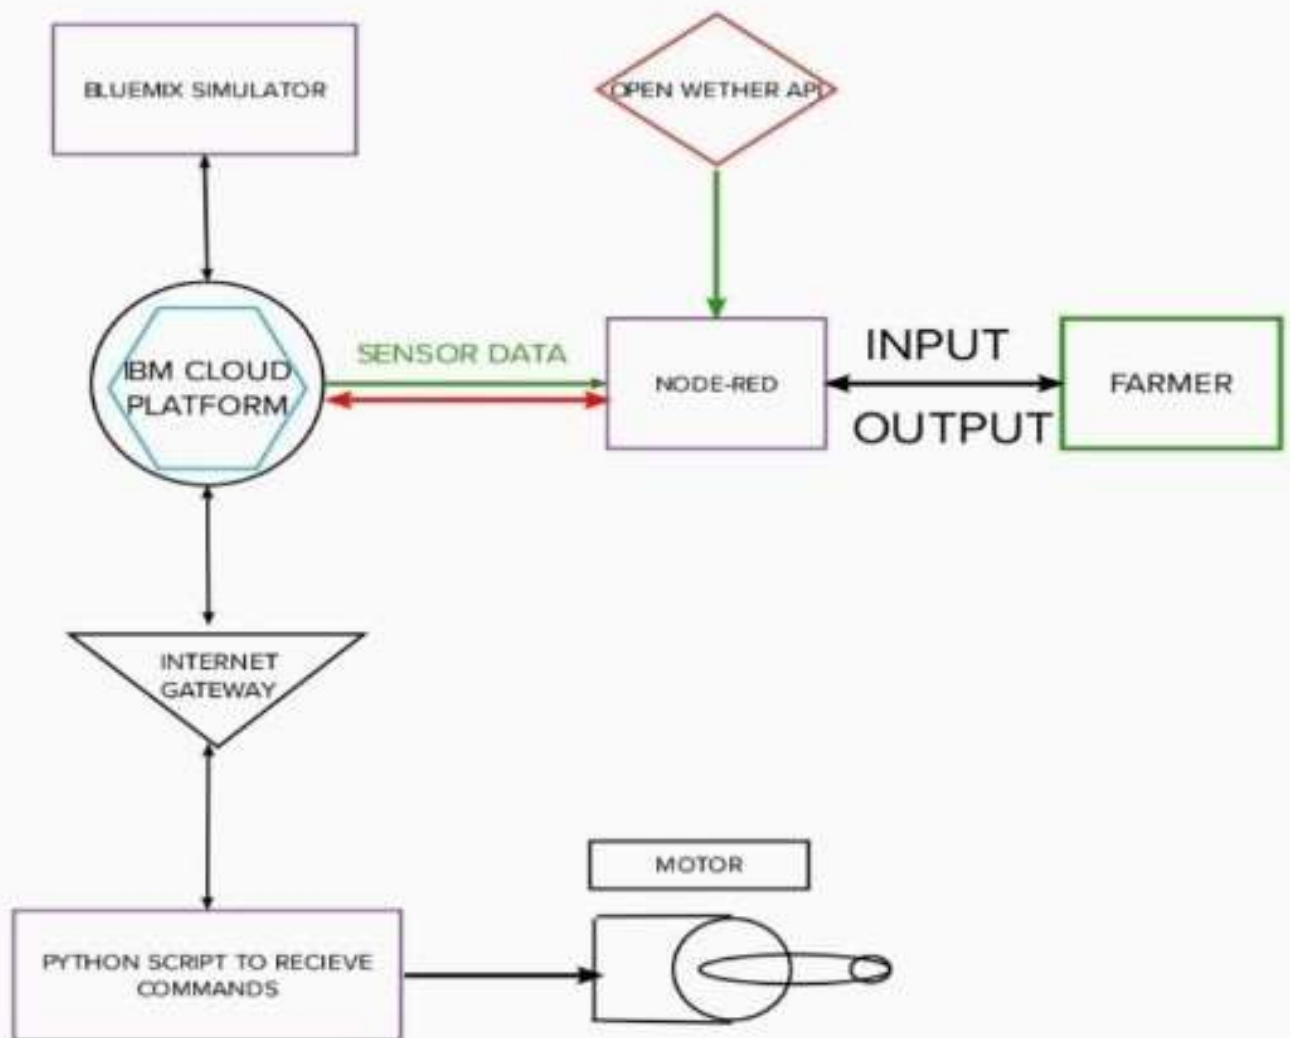

To provide an efficient decision support system using wireless sensor networks which handle different activities of the farm and give useful information related to soil moisture, Temperature and

Humidity content. Due to the weather condition, water level increases, Farmers get a lot of distractions which is not good for Agriculture.

## **4. Theoretical Analysis:**

### **4.1 Block Diagram:**

In order to implement the solution , the following approach as shown in the block diagram,is used

## **4.2 Required Software Installation:**

### **4.2.A Node-Red:**

Node-RED is a flow-based development tool for visual programming developed originally by IBM for wiring together hardware devices, APIs and online services as part of the Internet of Things. Node-RED provides a web browser-based flow editor, which can be used to create JavaScript functions.

- Open cmd prompt.
- Type=>Node-RED.
- Then open <http://127.0.0.1:1880/> on your browser.

## **Installation of IBM IoT and Dashboard nodes for Node RED:**

In order to connect to IBM Watson IoT platform and create the WEB UI these nodes are required.

1. IBM IoT node.
2. Dashboard node.

### **4.2.B IBM Watson IoT Platform:**

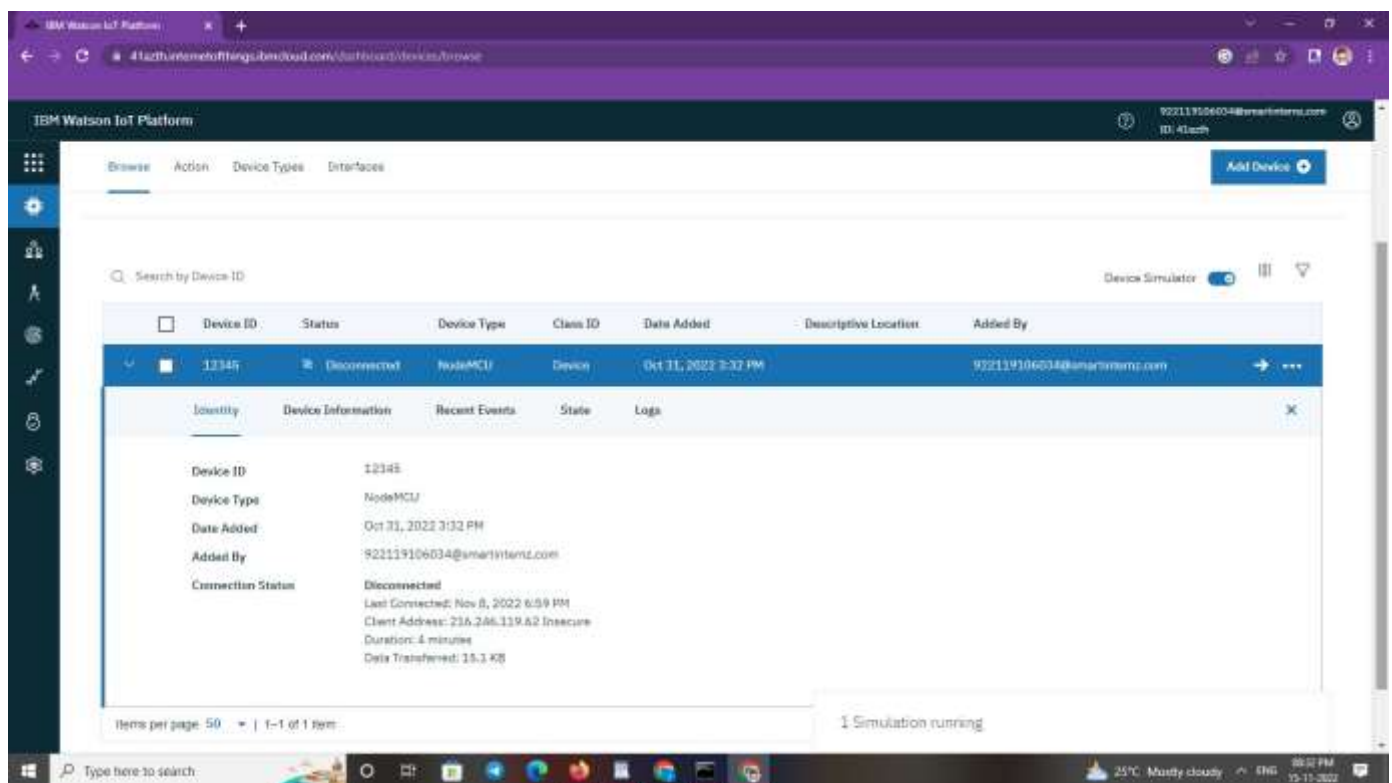

A fully managed, cloud-hosted service with capabilities for device registration, connectivity, control, rapid visualization and data

storage. IBM Watson IoT Platform is a managed, cloud-hosted service designed to make it simple to derive value from your IoT devices.

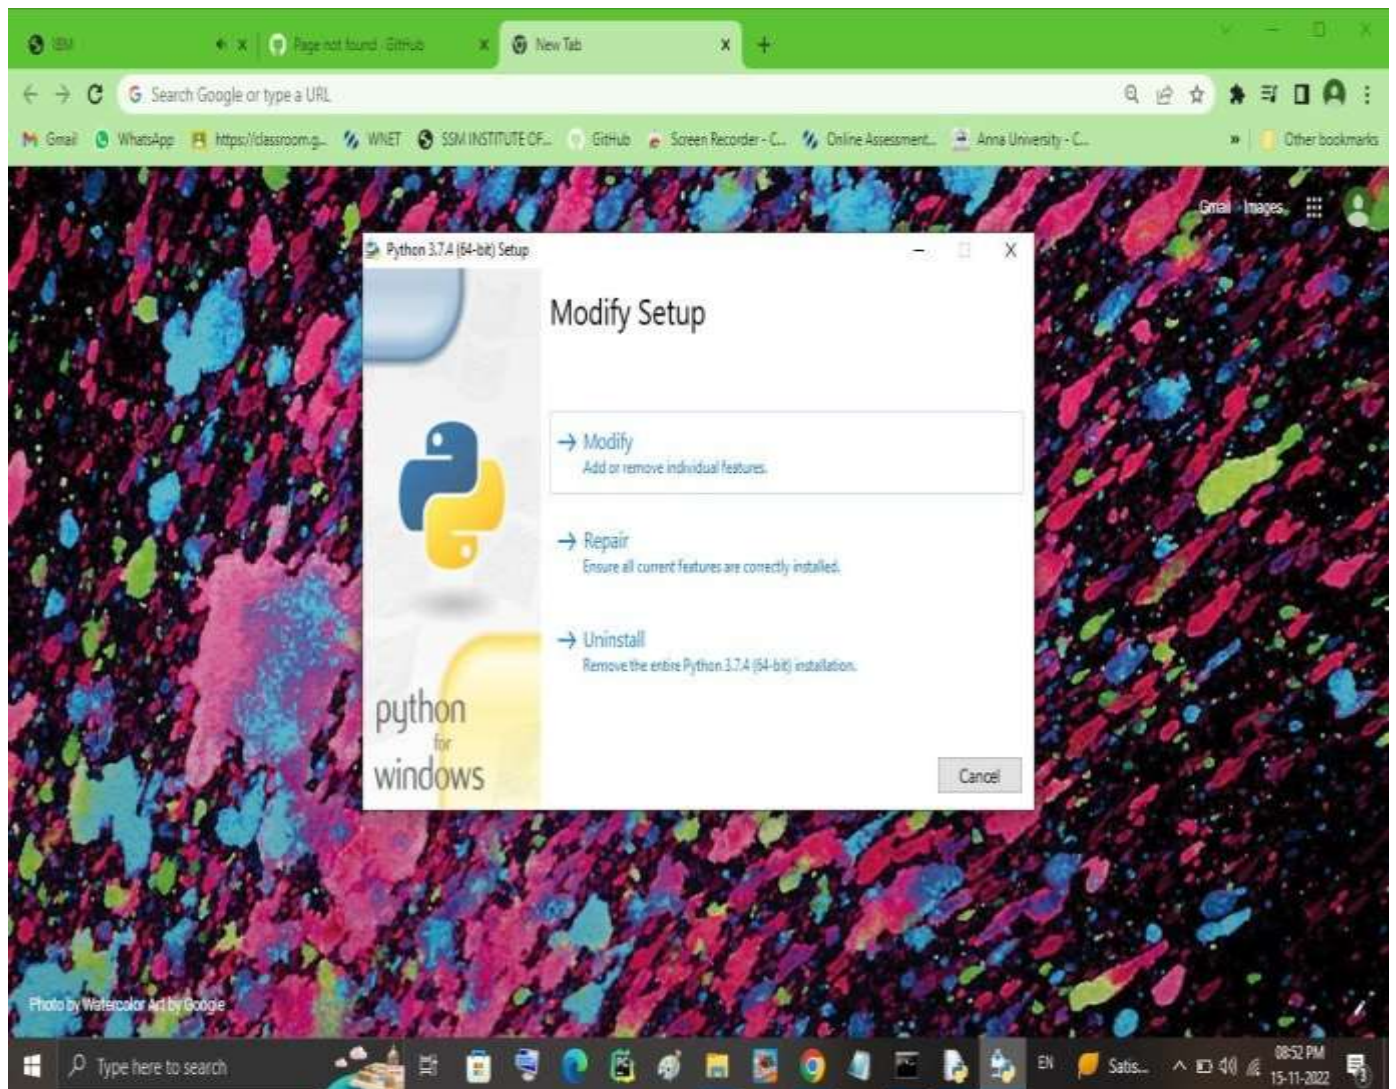

- Create a new device
- Give credentials like device type, device ID, Auth. Token
- Create API key and store API key and token elsewhere.

## 4.2.C Python IDE:

Install Python3 compiler

Install any python IDE to execute python scripts, in my case I used Command Prompt to execute.

## **Code:**

```
import wiotp.sdk.device
import time import os
import datetime import
random myConfig = {
"identity": {
"orgId": "u9qhfi",
"typeId": "Devicetype1",
"deviceId": "DeviceID1"
},
"auth": {
"token": ")hSb7_ZD+evl2fRhXi"
} }
client=wiotp.sdk.device.DeviceClient(config=myConfig,logHandlers=
None)
client.connect () def
myCommandCallback (cmd) :
print ("Message received from
IBM IoT Platform:
```

```

%s"% cmd.data['command'])
    m=cmd.data['command'] if
    (m=="motoron"): print ("Motor is
switched on") elif
    (m=="motoroff"):
        print ("Motor is switched OFF")
    print (" ")
while True:
    soil=random.randint (0,100)
    temp=random.randint (-20, 125)
    hum=random.randint (0, 100)
    myData={'soil moisture': soil, 'temperature':temp,
        'humidity':hum} client.publishEvent
        (eventId="status",msgFormat= "json", data=myData, qos=0
        ,onPublish=None) print ("Published data Successfully: %s",
        myData) time.sleep (2)
client.commandCallback = myCommandCallback
client.disconnect ()

```

## **Arduino code for C :**

```
#include <WiFi.h> //library for wifi
#include <PubSubClient.h> //library for MQTT
#include "DHT.h" // Library for dht11
#define DHTPIN 15    // what pin we're connected to
#define DHTTYPE DHT22 // define type of sensor DHT 11
#define LED 2

## **4.3 IoT Simulator:**

In our project in the place of sensors we are going to use IoT sensor simulator which give random readings to the connected Cloud.

### **The link to simulator:**

<https://41azth.internetofthings.ibmcloud.com/dashboard/devices/browse>

We need to give the credentials of the created device in IBM Watson IoT Platform to connect cloud to simulator.
